Acknowledgements

Thanks to the members of the Consumer Assessment of Healthcare Providers and Systems (CAHPS®) survey workgroup who assisted with the development of the survey materials, the client brochure, and the stakeholder report.

From the Aging and Disability Services Administration (ADSA):

- Candace Goehring, Unit Manager, Home and Community Programs
- Dan Murphy, Office Chief

From the Health and Recovery Services Administration (HRSA):

- Shirley Munkberg, Acting Office Chief, Office of Quality and Care Management

We would like to thank:

Qualis Health:

- Qualis Health, a health care quality improvement organization, coordinated the project, conducted the analysis, assisted in development of the survey booklet, and developed this stakeholder report to disseminate the survey results.

DataStat:

- Qualis Health coordinated with DataStat, Inc., a survey research organization located in Ann Arbor, Michigan, to collect the mail and telephone survey responses.

Sincerely,

Candace Goehring
Unit Manager, Home and Community Programs
Aging and Disability Services Administration

Dan Murphy
Office Chief

Introduction

This report is designed to enable the Aging and Disability Services Administration (ADSA), Washington Chronic Care Management Program vendors, and other organizations to monitor and evaluate the performance of the Aging and Disability Services Administration Chronic Care Management Project. A client satisfaction survey was conducted and the responses of adults enrolled in Medicaid regarding their experiences with their health care services were analyzed. Medicaid recipients from each of the three program groups—randomized to participate *and* successfully enrolled in the project (“Enrolled”), randomized to participate but not successfully enrolled (“Not Enrolled”), and randomized to the control group—were surveyed and the results are presented here. Details of the survey administration, sampling, response rates, and weighting can be found in the Detailed Methodology Report.

This report describes the background of the questionnaire, which includes questions from the Medicaid Consumer Assessment of Healthcare Providers and Systems (CAHPS®) survey, the 8-element Client Satisfaction Questionnaire© (CSQ-8), the 13-element Patient Activation Measure© (PAM-13), the 5-element EQ-5D, and questions developed by the WA Department of Social and Health Services (DSHS). A description of project goals and how to interpret the results is also included.

Project Background

This client satisfaction survey project used questions from 4 survey instruments: CAHPS® survey, PAM-13©, CSQ-8©, and EQ-5D. DSHS also included questions developed by department staff.

The CAHPS survey tools were developed under cooperative agreements by Harvard Medical School, the RAND Institute, the Research Triangle Institute, and the Agency for Healthcare Research and Quality. HRSA has administered a version of CAHPS for various programs in Washington State for the past 12 years, although this is the first year a CAHPS survey has been used for the King County Local Chronic Care Management Program. In CAHPS surveys, respondents provide information about their experiences with various aspects of medical care, including:

- Getting care that is needed
- Getting care without long waits
- How well doctors communicate
- How people rated their health care
- How people rated their personal doctor or nurse
- How people rated the specialist they saw most often

The PAM-13© was developed at the University of Oregon Eugene by Judith H Hibbard, Eldon R Mahoney, Jean Stockard, and Martin Tusler. The PAM-13© is constructed to measure the level of patient activation in their own health care. The CSQ-8© was developed at the University of California San Francisco by Drs. Clifford Attkisson and Daniel Larsen in collaboration with Drs. William A. Hargreaves, Maurice LeVois, Tuan Nguyen, Robert E. Roberts, and Bruce Stegner. The CSQ-8© instrument is constructed to measure general satisfaction with services received by individuals and families. The EQ-5D is a widely used instrument to describe generic health status in terms of 5 dimensions:

- Mobility
- Self-care
- Usual activities
- Pain/discomfort
- Anxiety/depression

2008 Washington State Medicaid Aging and Disability Services Administration Chronic Care Management Project Client Satisfaction Survey

A complete copy of this report is available at
<http://www.adsa.dshs.wa.gov/professional/hcs.htm>.

Each dimension comprises 3 levels, indicating no problems, some or moderate problems, and extreme problems. Assessing the percentage of enrollees who are in poor health or who have chronic conditions is important to ensure adequate provider access, appropriate range of services, and financing for health services. Details of EQ-5D development and current status may be found online at <http://www.euroqol.org/>.

A copy of the 2008 survey instrument is included at the end of this report in Appendix A.

Project Goals

The primary goal of the Medicaid client satisfaction survey project is to provide timely information to the ADSA, Washington Chronic Care Management Program to assist in evaluating the quality of the Intensive Chronic Care Management Program. This information was collected through mail and telephone surveys that assessed clients' experiences with the health care and services they received through either standard Medicaid services or, if enrolled, the Intensive Chronic Care Management Program.

How to Use This Report

This report is designed to allow the ADSA and other stakeholders to identify key opportunities to improve clients' health care experiences. This report includes data from two Medicaid subpopulations: those randomized to the Intensive Chronic Care Management Program ("Treatment"), and those randomized to a control group. A total of 568 surveys (46.9%) out of a sample frame of 1,212 eligible enrollees met completeness criteria for inclusion in this report by answering at least 1 question in the survey.

Results are displayed in a graphical format with 1 question per page. The first line of the page heading displays the program name (Aging and Disability Services Administration Chronic Care Management Project). The second line lists the question source (e.g., CAHPS, PAM-13©). The third line is a brief description of the question category (e.g., Your Personal Doctor, Utilization, Flu Shot) along with the question number from the original questionnaire.

PAM-13© Activation Stages

Based on a national sample of 1,469, Insignia Health defined 4 stages of increasing patient activation as shown in the table below. A total is calculated for each respondent based on their responses to 13 individual questions. A response of "Strongly Disagree", "Disagree", "Agree", or "Strongly Agree" is awarded 1, 2, 3, or 4 points, respectively. For items with a response of "Not Applicable", the PAM raw score is the respondent's total score divided by the number of completed items and multiplied by 13. If the respondent did not respond "Not Applicable" to any item, the total is the PAM raw score.

**2008 Washington State Medicaid Aging and Disability Services Administration
Chronic Care Management Project Client Satisfaction Survey**

A complete copy of this report is available at
<http://www.adsa.dshs.wa.gov/professional/hcs.htm>.

PAM-13 Activation Stage Description

PAM Raw Score	Activation Stage	Definition	Percent of National Sample (n=1,469)
≤ 47.0	Stage 1	May not yet believe that the patient role is important	11.8%
47.1 to 55.1	Stage 2	Lacks confidence and knowledge to take action	29.3%
55.2 to 67.0	Stage 3	Beginning to take action	36.5%
≥ 67.1	Stage 4	May have difficulty maintaining behaviors over time	22.3%

What do the bar graphs tell you?

A series of bar graphs display survey results on pages 7-75. Each page represents results for 1 composite question or one question using 2 bar graphs; 1 for the treatment and 1 for the control group. The number of clients answering each question is included as a footnote to each graph.

Each bar graph is divided into 2-, 3-, or 4-response categories that represent the unadjusted percent response to 1 question or composite question for each subpopulation. The individual categories add up to 100%, although sections for some graphs may not appear to add up to 100% because of rounding of individual sections for display. Some responses were recoded down to 3 or 4 categories for easier visual interpretation. For example, the global rating scales of 0 – 10, the “How often” scales of never, sometimes, usually, always, and the CSQ-8© scales of 4 levels of agreement were recoded for display as 3 categories. Client age, educational level, and health care utilization questions were collapsed to 4 categories. The “N/A” responses of the PAM-13© individual questions and “don’t know” response to whether clients received a flu shot were ignored for display and statistical analysis. In no case did the “N/A” or “don’t know” response exceed 10% of the total responses for either subpopulation.

Statistical Significance

Stars were added to each bar chart in which the responses of clients in the treatment group were significantly different than the responses of clients in the control group. P-values less than or equal to 0.05 were considered significant. The number of stars added corresponds to the level of significance. Please refer to the legend on the individual graphs for more specific details. When the treatment and control group responses to a question were not statistically different from each other, no stars were added to the bar charts.

Limitations

People in worse health tend to report lower satisfaction and more problems with care than do people in better health. Older patients tend to report more satisfaction and fewer problems than do younger patients. There is some evidence that education level may affect scores as well, although the effects of age and education are not as strong as health status. Therefore, differences in client satisfaction may be due to sampling error or self-selection bias and not to differences in program quality or satisfaction.

Additionally, there is potential response bias in the survey results. The accuracy of these findings depends on how well respondents represent the overall population under study. If the 46.9% of clients that responded to the survey are systematically different than the study population, then conclusions drawn here may be incorrect

**2008 Washington State Medicaid Aging and Disability Services Administration
Chronic Care Management Project Client Satisfaction Survey**

A complete copy of this report is available at
<http://www.adsa.dshs.wa.gov/professional/hcs.htm>.

Finally, due to the study design, in which clients were randomized to the treatment and control groups prior to enrollment in the program, an intent-to-treat analysis was performed. This means a large percentage of those clients randomized to the treatment group (and analyzed as such) chose not to enroll in the program and therefore did not actually receive program services. If in fact the program was effective at improving clients' health care experiences and satisfaction, this would dilute the program effect and diminish the ability of this survey to detect statistically significant differences.

Summary of Statistically Significant Results

Statistically significant results of treatment and control group response comparisons are listed below.

More clients in the treatment group reported:

- An overall rating of 7-8 for their personal doctor
- “Usually” getting an appointment at a doctor’s office or clinic as soon as they thought they needed it
- That pain “Never or Sometimes” limited their ability to do the things they needed to do
- Having moderate pain or discomfort
- Strongly agreeing that they were responsible for taking care of their health problems.
- Having a “Fair” overall health rating
- “No change” in their overall ability to care for themselves compared to 6 months ago
- They had some problems with performing their usual activities
- Responses that classified them in PAM stage 3 “Beginning to take action”
- They “agree” that they know how to prevent further problems with their health
- That they held a 4-year college degree or more

More clients in the control group reported:

- An overall rating of 0-6 for their personal doctor
- “Never or Sometimes” getting an appointment at a doctor’s office or clinic as soon as they thought they needed it
- That pain “Usually” limited their ability to do the things they needed to do
- Visiting their personal doctor “10 or more” times in the last 6 months
- Reducing their smoking or use of tobacco products in the past year
- They needed more help caring for themselves compared to 6 months ago
- They were unable to perform their usual activities
- Responses that classified them in PAM stage 2 “Lacks confidence and knowledge to take action”
- They “disagree” that they know how to prevent further problems with their health
- The highest level of education they had completed was “some high school”

Aging and Disability Services Administration Chronic Care Management Project

Consumer Assessment of Healthcare Providers and Systems Core: Question 7

Results are based on 136 responses from the treatment group and 416 responses from the control group to this question. When weighted these responses represent 266 and 911 individuals in the treatment and control groups respectively.

The results presented in this report are based on the 2008 Washington State Medicaid Aging and Disability Services Administration Chronic Care Management Project. The bar graphs show the weighted proportions for both the treatment and control groups. Overall Chi square test results are noted for significant findings. Due to rounding, some bars may not add to 100 percent.
